*Author for Correspondence

ABSTRACT

Survey of angiospermic climbers from the Andaman Islands recorded 1119 species under 136 genera belonging to 50 families. The ratio of dicotyledons to monocotyledons climbers is near about 6.81:1. Maximum number of 24 sp. recorded for convolvulaceae followed by Papilionaceae (23 sp.). *Dioscorea* (9 sp.) is the most predominant climbing genera. Twiners are most predominant with 159 species followed by tendril climbers (38 species) and hook climbers (36 species). 19 sp. of climbing plants are randomly found in different Islands.

Keywords: Climbing Plants, Presence Class, Andaman Islands

INTRODUCTION

Climbing plants are one of the most interesting group but a much neglected group of plants. Climbers represent a very conspicuous and dominant growth form in tropical forest. These are the plants that germinate on floor and grow part of their life by winding ground, anchoring or adhering to other plants (Jongkind and Hawthrone, 2005) to attain great stature (Swaine and Grace, 2007).

Interest in liana inventory has recently gained currency (DeWalt *et al.*, 2000; Muthuramkumar and Parthasarathy, 2001; Perez- Salicrup *et al.*, 2001; Phillips *et al.*, 2002; Reddy and Parthasarathy, 2003; Kouame *et al.*, 2004; Mascaro *et al.*, 2004; Parthasarathy *et al.*, 2004; Rice *et al.*, 2004; Phillips *et al.*, 2005; DeWalt *et al.*, 2006; Ghosh, 2013, Ghosh *et al.*, 2013). However, information on medium to long-term inventory is scanty in most cases (Phillips *et al.*, 2005).

In Andaman Islands, Prasad *et al.*, (2009) recorded 119 climbing plants from North Andaman. But no comprehensive study has been done regarding the angiospermic climbers of Andaman Islands.

MATERIALS AND METHODS

The present work is the outcome of extensive survey at different corners of the Islands in different seasons. The islands extend from 6° to 14° North latitudes and from 92° to 94° East longitudes, covering an area of 7,950 km²

For collection and preservation of plant specimens and to document the information, the author followed the guidelines as mentioned by Jain (1965), Jain and Rao (1977) and Pal and Jain (1999) with some minor modifications wherever necessary. Climbers were identified with the help of published flora (Perkinson, 1923; Hooker, 1872-1885; Gamble & Fisher, 1921-1935; Mathew, 1991). Voucher specimens were deposited at the CU Herbarium.

RESULTS AND DISCUSSION

A total of 1119 species of climbers and lianas were identified from the different type of forests of Andaman Islands. They are represented by 250 species of angiosperms, 2 ferns (Pteridophytes) and a single gymnosperm (Fig.1). The 50 families of the dicotyledons have 218 species under 121 genera, while 7 families of the monocotyledons have 32 species under 12 genera. Total number of genera is 2 in the pteridophytes under 2 families and a single one under the gymnosperms.

Species wise, major families are: Convolvulaceae (24), Papilionaceae (23), Asclepiadaceae (20), Menispermaceae (17), Vitaceae (13), Arecaceae (11), Apocynaceae (10), Oleaceae (10), Dioscoreaceae

Research Article

(9), Anonaceae (8), Caesalpiniaceae (8), Rhamnaceae (7), Smilacaceae (7), Thunbergiaceae (6), Combretaceae (5) and Cucurbitaceae (5). Families represented by single member each are: Asteraceae, Boraginaceae, Connaraceae, Dilleniaceae, Hernandiaceae, Icacinaceae, Malvaceae, Olacaceae, Ranunculaceae, Sapindaceae, Verbenaceae, and Flagellariaceae (Table 1).

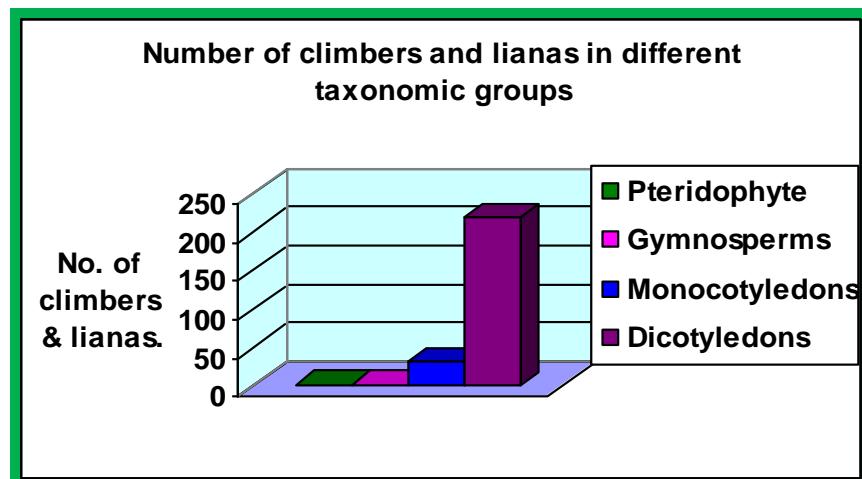

Figure 1: Number of climbers and lianas in different taxonomic groups

Genera with 5 species or more are: *Argyreia* (5), *Caesalpinia* (6), *Calamus* (5), *Derris* (6), *Dioscorea* (9), *Ipomoea* (8), *Jasminum* (8), *Smilax* (6), *Stephania* (5), *Tetrastigma* (5), *Thunbergia* (6).

Families represented by climbers only are: Araceae, Aristolochiaceae, Asclepiadaceae, Convolvulaceae, Cucurbitaceae, Cuscutaceae, Menispermaceae, Passifloraceae, Piperaceae and Vitaceae.

The total number of herbaceous climbers is 147 (58.1%) and that of woody lianas is 106 (41.9%) respectively (Fig. 2). The number of herbaceous climbers in the dicotyledons is 125 (49.41%) and in the monocotyledons it is 20 (7.9%) only. Amongst the dicotyledons 105 (41.5%) species are lianas as is the single gymnosperm. Pteridophytes have 2 climbers.

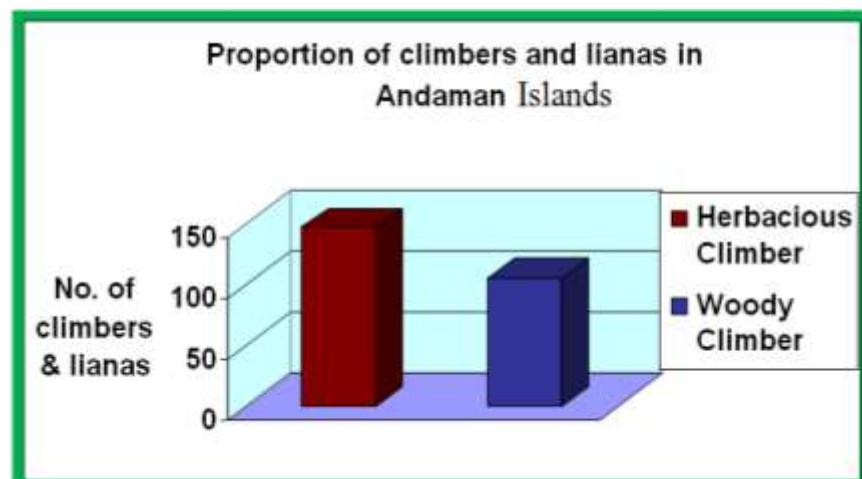

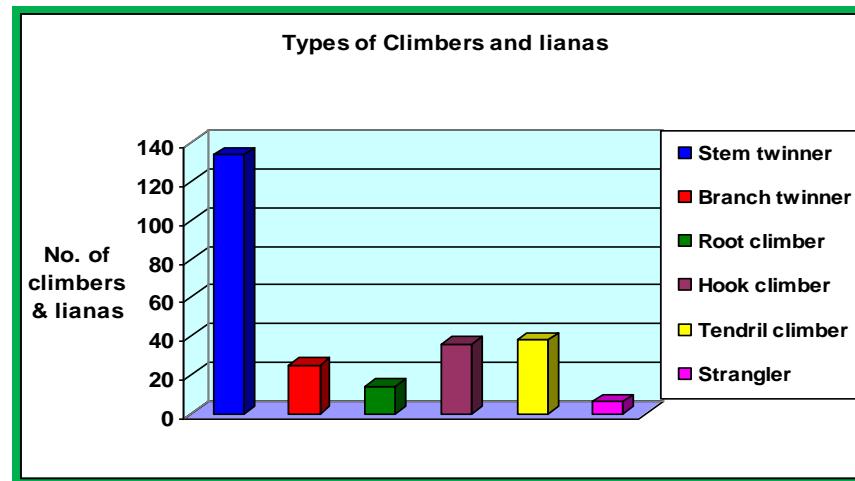

Figure 2: Proportion of climbers and lianas in Andaman Islands

Taken together, there are 134 (52.96%) stem twiners, 36 (14.22%) hook climbers, 38 (15.02%) tendril climbers, 25 (9.88%) branch twiners, 14 (5.53%) root climbers and 6 (2.37%) stranglers (Fig. 3).

Research Article**Figure 3: Types of climbing plants**

It is found that 19 sp. of climbing plants are randomly distributed in different Islands with the highest percentage (E=81-100%) and there are about 139 sp. of climbing plants are isolated in certain Islands (A=1-20%). (Table: 1).

Symbols depict as follows: NA = North Andaman; MA = Middle Andaman; SA = South Andaman; LA = Little Andaman; NN = North Nicobars; CN = Central Nicobars; SN = South Nicobars; Presence Class- A represents distribution in 1-20% groups of Islands; B in 21-40%; C in 41-60%; D in 61-80% and E in 81-100%. C = Climber, L = Liana; E Cl = Epiphytic Climber

Research Article

ACKNOWLEDGMENT

I am grateful to Prof. P.K. Mukherjee and Dr. Krishna Chaudhury, Department of Botany; Calcutta University. Author is also thankful to Forest Department of Andaman & Nicobar Islands for their necessary logistic support and Botanical survey of India, Port Blair. This study was funded by DBT-DOS. India.
