#### Abstract

Ellipse is one of the conic sections. It is an elongated circle. It is the locus of a point that moves in such a way that the ratio of its distance from a fixed point (called focus) to its distance from a fixed line (called directrix) equals to constant ' $e$ ' which is less than or equal to unity. According to Keplar's law of Planetary Motion, the ellipse is very important in geometry and the field of Astronomy, since every planet is orbiting its star in an elliptical path and its star is as one of the foci. The Perimeter is one of the important parameters of an ellipse. The results of existing formulae for calculating the values of Perimeter which are empirical formulae, inaccurately and/ or are called approximations. All these formulae results have relative error. Unlike the existing formulae, the new formula has been derived mathematically and proved its performance to be the best. In this paper, step by step derivation and its development from some basic concept of ellipse has been presented. A new theorem which defines the property of perimeter-radius of ellipse also has been developed and defined. This is an advancement in the development of more accurate formula for Perimeter of ellipse.

Key Words: Ellipse, Conic Sections, Keplar's Law of Planetary Motion, Eccentricity of ellipse, Focus, Directrix, Major axis, Minor axis, Perimeter-radius, Periapsis, Comet, Asteroids and Perimeter of an ellipse.

## INTRODUTION

Here are some other common places where ellipses are found (Douglas 2003):
(i) The shape of a spotlight on a planar surface is in most cases an ellipse. In some cases it may be a circle.
(ii) If you cut a cylinder at an angle, you will get elliptical sections. This can have important applications in optics (lenses and mirrors can be elliptical in shape), or in the kitchen (where one might cut vegetables or sausage along a "bias cut" in order to obtain pieces that have the same thickness, but have more surface area.
(iii) Some tanks are in fact elliptical (not circular) in cross section. This gives them a higher capacity, but with a lower center-of-gravity, so that they are more stable when being transported. And they're shorter, so that they can pass under a low bridge. It might be seen that these tanks transporting heating oil or gasoline on the highway
(iv) The ellipse is found in art and architecture as well as and one may be familiar with the Ellipse, part of a U.S President's Park South (a National Park in Washington DC, just south of the White House).
(v) Ellipses (or semi-ellipses) are sometimes used as fins or airfoils in structures that move through the air. The elliptical shape reduces drag.
(vi) In a bicycle, you might find a chain wheel (the gear that is connected to the pedal cranks) that is approximately elliptical in shape. Here the difference between the major and minor axes of the ellipse is used to account for differences in the speed and force applied, because your legs push and pull more effectively when the pedals are arranged so that one pedal is in front and one is in back, than when the pedals are in the "dead zone" (when one pedal is up and one pedal is down).

## Research Article

## EXISTING FORMULAE AND METHODS

There are simple formulae but they are not accurate. There are accurate formulae but they are not simple. Several attempts for more than past couple of centuries was been made by many Mathematicians to develop exact formula. However, all these are empirical [Borowski. E.J \& Borwein. J.M (1991)] formulae and were not derived from first principles any fundamental concept related to ellipse.
For the parametric equation of ellipse $x=a \cos \theta^{\circ}$ and $y=b \sin \theta^{\circ}$, the formula to calculate Perimeter of an ellipse (Zwillinger Daniel 2002) is generally defined as:
$P=a \int_{0}^{2 \pi} \sqrt{1-e^{2} \cos ^{2} \theta} d \theta$

where, ' $a$ ' is semi-major axis and ' $e$ ' is eccentricity of the ellipse [Eric Weisstein (2002)] $=\sqrt{ }\left[\left(a^{2}-b^{2}\right) / a^{2}\right]$. The solution for the above integration for Perimeter is the complete elliptic integral of the second kind (Borowski and Borwein, 1991). The solution for this integral function is as infinite series
$\mathrm{P}=2 \pi \mathrm{a}\left\{1-\left[\left(\frac{1}{2}\right)^{2}\left(\frac{e^{2}}{1}\right)\right]-\left[\left(\frac{1 \times 3}{2 \times 4}\right)^{2}\left(\frac{e^{4}}{3}\right)\right]-\cdots-\left[\left(\frac{(2 n-1)!}{2 n!}\right)^{2}\left(\frac{e^{2 n}}{2 n-1}\right)\right] \ldots\right\}--[2]$
The main disadvantage of this formula is that the degree of accuracy depends upon the number of terms taken into account for calculation. Following are some of such formulae (Michon, 2000, 2011):
(i) The first empirical formula in $\mathbf{1 7 4 2}$ by Colin Maclaurin
(1)
$P \approx 2 \pi a\left[1-\left(\frac{1}{4}\right) e^{2}-\left(\frac{3}{64}\right) e^{24}-\left(\frac{5}{256}\right) e^{6}-\cdots\left(\frac{1}{2 n-1} \times\left[\frac{2 n!}{\left(2^{2} n!\right)^{2}}\right]^{2}\right) e^{2 n}-\ldots\right]--[3]$ where, $e=\sqrt{\frac{a^{2}-b^{2}}{a^{2}}}$
(2) $\mathrm{P} \approx 2 \pi a\left[1-\left(\frac{1}{4}\right) e^{2}-\left(\frac{3}{64}\right) e^{4}-\left(\frac{5}{256}\right) e^{6}-\left(\frac{85}{8192}\right) e^{8}-\left(\frac{231}{32768}\right) e^{10}-\cdots\right]---[4]$
but it having relative error about $3.727 \times 10^{-13}$
(ii) Ramanujam \& Lindner in 1914
$p \approx \pi[3(a+b)-\sqrt{(3 a+b)(a+3 b)}] \approx \pi(a+b)[3-\sqrt{4-h}] \quad-\cdots----[5]$
where, $h=\left(\frac{a-b}{a+b}\right)^{2}$
(ii) Lindner
$P \approx \pi(a+b)\left[1+\left(\frac{h}{8}\right)\right]^{2}$

## Research Article

where, $\quad \delta=\left(\frac{a^{2}-b^{2}}{a^{2}+b^{2}}\right)^{2}=\frac{4 h}{1+h^{2}}$
Thus, the effort was being continued for more than couple of centuries.
NECESSITY \& IMPORTANCE OF PRECISE FORMULA
The earlier formula (Rod Pierce, 2011) to calculate Perimeter of an ellipse is generally an infinite series defined as:
$P=2 \pi a\left\{1-\left[\left(\frac{1}{2}\right)^{2} \times\left(\frac{e^{2}}{1}\right)\right]-\left[\left(\frac{1 \times 3}{2 \times 4}\right)^{2} \times\left(\frac{e^{4}}{3}\right)\right]-\left[\left(\frac{1 \times 3 \times 5}{2 \times 4 \times 6}\right)^{2} \times\left(\frac{e^{6}}{5}\right)\right]-\cdots\right\}--[36]$
The problem with above eqn. [36] is a transcendental function and its evaluation through infinite series or fractions is computationally inefficient, especially when implemented on simple microprocessors using floating point emulation software or hard-wired in FPGA's (Field Programmable Gate Arrays). For this reasons, various authors have proposed a number of approximations to Perimeter using simple algebraic expressions or, at most, formulae containing only commonly used functions such as square root, generic powers, arctangent, etc.,
Rather strangely, the perimeter of an ellipse is very difficult to calculate. As described in the previous section, it seems that all mathematicians found it difficult to find out an exact formula for it. Now the author has also attempted but in a different manner such that in spite of attempting as empirical effort the derivation of formula started from the fundamental logic related to ellipse. It is to be examined whether the long journey of approach for a precise formula was now come to an end by the invention of this new formula.

## BASIC CONCEPTUAL LOGIC \& DEVELOPMENT OF FORMULA

## Basic Concept from some fundamental logic for development of the formula

In this regard, the author has also made several attempts for past more than couple of years. Finally he has made an attempt to study the pattern, curve \& variation of perimeter-radius ( $r_{p}$ ) and Perimeter. The author has plotted a graph of quarter portion of ellipse (Fig.1) based on the following operation and curve by connecting all the extreme points of all perimeter-radius corresponding to the various values of $a \& b$ such that $(0 \leq b \leq a)$ and ' $a$ ' is as constant. The value of ' $a$ ' is limited to 15 units so that the graph pattern can be seen very clearly. The values of Perimeter of each value of 'b' are worked out by the following expansion (Rod Pierce, 2011)
$P=2 \pi a\left\{1-\left[\left(\frac{1}{2}\right)^{2}\left(\frac{e^{2}}{1}\right)\right]-\left[\left(\frac{1 \times 3}{2 \times 4}\right)^{2}\left(\frac{e^{4}}{3}\right)\right]-\cdots-\left[\left(\frac{1 \times 3 \times \ldots 21}{2 \times 4 \times \ldots 22}\right)^{2}\left(\frac{e^{22}}{21}\right)\right]\right\}---[37]$
The values of Perimeter-radius ' $r_{p}$ ' were worked out from its Perimeter. The values are presented in the table-1. The curve by connecting all the extreme points of all perimeter-radius ' $r_{p}$ ' corresponding to the various values of ' b ' also plotted in the same graph. The same was studied thoroughly with respect to the variation of ' $r_{p}$ '.
After plotting the graph, the author has observed that the Perimeter -radius ( $r_{p}$ ) is always
such that: $\mathrm{r}_{\mathrm{p}}=\frac{2 \mathrm{a}}{\pi}$ when $\mathrm{b}=0$ and $\mathrm{r}=\frac{\mathrm{a}}{\sqrt{2}}$ when $\mathrm{b}=\mathrm{a}$. It is an important observation
which paved way for the idea to develop the new formula. This can be described such that in any ellipse it is true that: If $b \rightarrow 0$, Permeter $(\mathrm{P}) \rightarrow 4 \mathrm{a}$ and
If $b \rightarrow a$, Permmeter $(P) \rightarrow 2 \pi$. Let, Perimeter $(P)=2 \times \pi \times r_{p}$
$\therefore r_{p}=\frac{P}{2 \pi}$
Where, the value of P is obtained from eqn. [37]

## Research Article

Therefore: (i) if $b \rightarrow 0, r_{p} \rightarrow \frac{4 \pi}{2 \mathrm{a}} \therefore$ if $\mathrm{b}=0, \mathrm{r}_{\mathrm{p}}=\frac{2 \pi}{\mathrm{a}}$
Similarly: (ii) if $b \rightarrow a, r_{p} \rightarrow \frac{2 \pi a}{2 \pi} \therefore$ if $b=a, r_{p}=a$
Let, $\theta=\tan ^{-1}\left(\frac{Y}{X}\right)$
Therefore:(iii) if $b \rightarrow 0, \theta \rightarrow 0 \therefore$ if $b=0, \theta=0$
Therefore: (iv) if $b \rightarrow a, \theta \rightarrow 0 \therefore$ if $b=a, \theta=\frac{\pi}{4}$
From [2] \& [4] (i) if $b=0, \quad x=r_{p} \times \cos \theta=\left(\frac{2 \pi}{a}\right) \times \cos (0)=\frac{2 \pi}{a}$
From [3] \& [5] (i) if $b=a, \quad x=r_{p} \times \cos \theta=(a) \times \cos \left(\frac{\pi}{4}\right)=\frac{a}{\sqrt{2}}$

## Derivation of formula

As per discussion above, for any value of ' $b$ ' and keeping the value of ' $a$ ' is constant, it is well confirmed that
$\frac{2 a}{\pi}<x<\frac{a}{\sqrt{2}}$
Moreover, it is linear variation, since the power of ' $a$ ' is unity. Fig. 2 is a graph defining the above value of ' $x$ '. In this fig., point ' $A$ ' is the origin, AH is the lowest value of ' $x$ ', BD is the highest value of ' $x$ ', horizontal axis represents the ' b ' value and vertical axis represents the ' $x$ ' value.
$\mathrm{b}=0$ at point A and $\mathrm{b}=\mathrm{a}$ at point B .
$A B=a$
$A H=\frac{2 a}{\pi}$
$\mathrm{BD}=\frac{\mathrm{a}}{\sqrt{2}}$
$A E=b$
In trapezium $\mathrm{AHBD}, \quad \mathrm{CD}=\mathrm{BD}-\mathrm{BC}$
$\therefore C D=B D-A H \quad(\because B C=A H)$
Substituting [47] and [46] in above relation, we get
$\mathrm{CD}=\frac{\mathrm{a}}{\sqrt{2}}-\frac{2 \mathrm{a}}{\pi}$
$\therefore C D=\frac{a \pi-2 a}{\pi \sqrt{2}}$
$\therefore \mathrm{CD}=\frac{\mathrm{a}(\pi-2)}{\pi \sqrt{2}}$
By using the graph, the ' $x$ ' value corresponding to any value of ' $b$ ' can be calculated by linearinterpolation. In right angled triangle HCD . Let, $\mathrm{HF}=\mathrm{b}, \mathrm{EG}=\mathrm{x}, \mathrm{EF}=\mathrm{AH}=\mathrm{x}$ and $\mathrm{FG}=\mathrm{x}^{\prime \prime}$
$\frac{\mathrm{CD}}{\mathrm{HC}}=\frac{\mathrm{FG}}{\mathrm{HF}}$
$\therefore F G=\frac{C D}{H C} \times H F$
$\therefore F G=\frac{C D}{A B} \times H F$

## Research Article

$\therefore \mathrm{X}^{\prime \prime}=\frac{\mathrm{CD}}{\mathrm{AB}} \times \mathrm{AE}$
Substituting [49], [45] and [46] in above relation
$x^{\prime \prime}=\left(\frac{\left[\frac{a(\pi-2)}{\pi \sqrt{2}}\right]}{a}\right) \times b$
In the fig.2, $x=x^{\prime}+x^{\prime \prime}$
Substituting [50]and [46] in above relation
$x=\frac{2 \mathrm{a}}{\pi}+\left[\frac{\left(\frac{a(\pi-2)}{\pi \sqrt{2}}\right)}{\mathrm{a}} \times \mathrm{b}\right]$
Simplifying the above eqn. we get $\mathrm{x}=\frac{2 \sqrt{2}(\mathrm{a}-\mathrm{b})+\pi \mathrm{b}}{\pi \sqrt{2}}$
Referring fig.3, ' $O$ ' is the origin, $O Q=x, Q P=y$ and $O P=r_{p}$. The equation of ellipse [Zwillinger Daniel (2002)] with respect to Cartesian co-ordinates [Eric Weisstein (2002)]
( $\mathrm{x}, \mathrm{y}$ ) is
$\frac{x^{2}}{a^{2}}+\frac{y^{2}}{b^{2}}=1$
The above eqn. defines an ellipse can be traced as a closed curve that lies entirely between the lines $(x=+a) \&(x=-a)$ and the lines $(y=+b) \&(y=-b)$ with semi-major axis 'a' and semi-major axis ' b ' corresponding to $x$-axis and $y$-axis respectively, $\mathrm{a} \& \mathrm{~b}$ are assumed to be non-negative real numbers. For the purpose of the analysis, it may be assumed that $a>b$.
$\therefore y^{2}=\left(1-\frac{x^{2}}{a^{2}}\right) b^{2}$
$\therefore y^{2}=\left(\frac{a^{2}-x^{2}}{a^{2}}\right) b^{2}$
We know already that the extreme point of perimeter-radius is one of the points of the ellipse. Therefore, substituting the eqn. [51] in eqn.[52], we get
$\therefore y^{2}=\left(\frac{a^{2}-\left[\frac{2 \sqrt{2}(a-b)+\pi b}{\pi \sqrt{2}}\right]^{2}}{a^{2}}\right) b^{2}$
On rewritting, we get $y^{2}=\left(a^{2}-\left[\frac{2 \sqrt{2}(a-b)+\pi b}{\pi \sqrt{2}}\right]^{2}\right) \frac{b^{2}}{a^{2}}$
In right - angled triangle $O P Q\left(\right.$ fig, 3 ), $O P^{2}=O P^{2}+Q P^{2}$
$\therefore r_{p}{ }^{2}=x^{2}+y^{2}$. Substituting [51] and [53]in above eqn, we get
$r_{p}^{2}=\left[\frac{2 \sqrt{2}(a-b)+\pi b}{\pi \sqrt{2}}\right]^{2}+\left(a^{2}-\left[\frac{2 \sqrt{2}(a-b)+\pi b}{\pi \sqrt{2}}\right]^{2}\right) \frac{b^{2}}{a^{2}}$

## Research Article

$r_{p}{ }^{2}=\left[\frac{2 \sqrt{2}(a-b)+\pi b}{\pi \sqrt{2}}\right]^{2}+b^{2}-\frac{b^{2}}{a^{2}}\left[\frac{2 \sqrt{2}(a-b)+\pi b}{\pi \sqrt{2}}\right]^{2}$
$r_{p}{ }^{2}=\left[\frac{2 \sqrt{2}(a-b)+\pi b}{\pi \sqrt{2}}\right]^{2}\left(1-\frac{b^{2}}{a^{2}}\right)+b^{2}$
$r_{p}^{2}=\left[\frac{2 \sqrt{2}(a-b)+\pi b}{\pi \sqrt{2}}\right]^{2}\left(\frac{a^{2}-b^{2}}{a^{2}}\right)+b^{2}$
$r_{p}=\sqrt{\left[\frac{2 \sqrt{2}(a-b)+\pi b}{\pi \sqrt{2}}\right]^{2}\left(\frac{a^{2}-b^{2}}{a^{2}}\right)+b^{2}}$
$r_{p}=\sqrt{b^{2}+\left\{e\left[\frac{2(a-b)}{\pi}+\frac{b}{\sqrt{2}}\right]\right\}^{2}}$
The eqn. [53] is the Maran's formula arrived at to calculate the perimeter-radius of any ellipse.
As discussed in earlier section, the Perimeter of an ellipse $=2 \pi r_{p}$
Substituting, eqn. [54] in above, we get
Perimeter of ellipse $(P)=2 \pi \sqrt{b^{2}+\left\{\left(\frac{a^{2}-b^{2}}{a^{2}}\right) \times\left[\frac{2(a-b)}{\pi}+\frac{b}{\sqrt{2}}\right]^{2}\right\}}$ (or)
Perimeter of ellipse $(P)=2 \pi \sqrt{b^{2}+\left\{e\left[\frac{2(a-b)}{\pi}+\frac{b}{\sqrt{2}}\right]\right\}^{2}}$
where, e is the eccentricity of the ellipse. The eqn. [55] is the formula to calculate the Perimeter of any ellipse.

$$
\text { In fig. } 3, \tan \theta=\frac{P Q}{O Q}
$$

$\therefore \tan \theta=\frac{y}{x}$
Substituting [51] and [53]in above eqn, we get
$\tan \theta=\frac{\frac{b}{a} \sqrt{a^{2}-\left[\frac{2 \sqrt{2}(a-b)+\pi b}{\pi \sqrt{2}}\right]^{2}}}{\left(\frac{2 \sqrt{2}(a-b)+\pi b}{\pi \sqrt{2}}\right)}$
Simplifying, we get $\tan \theta=\frac{b}{a} \sqrt{\frac{2 a^{2} \pi^{2}-[2 \sqrt{2}(a-b)+\pi b]^{2}}{[2 \sqrt{2}(a-b)+\pi b]^{2}}}$
$\therefore \theta_{p}=\tan ^{-1}\left(\frac{b}{a} \sqrt{\frac{2 a^{2} \pi^{2}-[2 \sqrt{2}(a-b)+\pi b]^{2}}{[2 \sqrt{2}(a-b)+\pi b]^{2}}}\right)$

## Research Article

Where, $\theta_{p}$ is angle of perimeter- radius with periapsis (Fig.3)The eqn. [56] is the formula to calculate the slope of the perimeter-radius of any ellipse. Another formula for radius of ellipse [Zwillinger Daniel (2002)] in polar coordinates form at an angle $\theta^{\circ}$ with periapsis [Eric Weisstein (2002)] is
$\mathrm{r}=\frac{a b}{\sqrt{\mathrm{a}^{2} \sin ^{2} \theta^{2}+\mathrm{b}^{2} \cos ^{2} \theta^{2}}}$
By substituting the values obtained from eqn. [56] in above eqn., the perimeter-radius can also be calculated from the following formula.
$r_{p}=\frac{a b}{\sqrt{a^{2} \sin ^{2} \theta_{\mathrm{p}}+b^{2} \cos ^{2} \theta_{\mathrm{p}}}}$
NEW (MARAN'S) THEOREM ON PERIMETER-RADIUS OF ELLIPSE
If the Perimeter of an ellipse is defined in terms of its perimeter - radius ( $r_{p}$ ),
then (i) the value of $r_{p}=\frac{2 a}{\pi}$ when $b=0$, (ii) the value of $r_{p}=a$ when $b=a$.
(iii) For other intermediate values of ' $b$ ', the value of $\left(r_{p}\right)$ is equal to the value
calculated by linear - interpolation of (i) and (ii).
Where, ' $a$ ' $=$ semi-major axis and ' $b$ ' $=$ semi - minor axis

## RESULTS AND DISCUSSION

Table-2 is comparison of the results obtained by existing exact formula (expansion i.e. eqn. 36) and new formula (eqn. 55) for $\mathrm{a}=15$ and various values of $\mathrm{b}=0$ to 15 .
In this table, Column 1 is the serial numbers
Column 2 is the values of semi major axis ' $a$ '
Column 3 is the values of semi minor axis ' $b$ '
Column 4 is the values of Perimeter ' P ' calculated by using the existing formula (eqn. 37)
Column 5 is the values of perimeter-radius ${ }^{{ }^{\prime}{ }_{\mathrm{p}} \text { ' } \text { corresponding to col. } 4 \text { (eqn. 38) }{ }^{\text {( }} \text { ) }}$
Column 6 is the values of $\theta_{\mathrm{p}}{ }^{\prime}$ corresponding to col. 4 but was obtained from the graph (fig.1)
Column 7 is the values of $\mathrm{r}_{\mathrm{p}}$ ' calculated by using the new formula (eqn. 54)
Column 8 is the values of ' P ' calculated by using the New formula (eqn. 55) and
Column 9 is the values of Perimeter $\theta_{\mathrm{p}}{ }^{\prime}$ calculated by using the new formula (eqn. 56).
From the table, it can be clearly seen that the result of new formula is very close to result of existing series. The result of existing expansion for ' P ' may vary due to not taking of more terms in the series. For example:
(i) for $a=15 \& b=0$, the actual result of $P=4 a$ it should be 60 instead of 61.312 and
(ii) $r_{p}$ should be $=\frac{P}{2 \pi}=9.549$ instead of 9.758
(iii) Similarly, for $\mathrm{a}=15, \mathrm{~b}=0$, the actual result of $P=2 \pi a$ it should be 94,248 instead of 94.238 , since it is a circle and
(iv) $r_{p}$ should be equal to $a=15$ instead of 14.999. These are exactly correct in result obtained by the new formula only.
Table-3 is the comparison of results calculated by various formulae.

## CONCLUSION

In this paper the several existing formulae have been shown for the reference in order to understand the necessity of accurate formula. Although there are several empirical formulae are exists in practice, the new formula has been derived mathematically from the basic mathematical logic of the ellipse with appropriate illustrations for detailed explanation. A graph drawn for specific values of 'a' \& 'b' also plotted to study the pattern of the curve connecting the extreme points of the perimeter-radius. In the section of "Result \& Discussion", the results obtained from the new formula has been analyzed and compared with the other results for the same considered variables 'a' \& ' b '. Moreover, finally a new theorem has also been presented.
As per Keplar's first law of planetary motion, all Planets including Comets [Eliot. T.S (1994-2011)] and Asteroids [Ed Grayzeck (2012)] which are in space rotate in elliptical path as its star is one of the foci of that ellipse. There are many possibilities of hazards and natural calamity due to very high impact will take place when collision of planets and comets or/asteroids which are rotating around our sun having orbit of higher eccentricity are more vulnerable especially to earth. It is one of the natural and solar terrestrialphenomena happen normally in space. Therefore, this may have application to trace out the path of the comets/ asteroids accurately in order to take precautionary and preventive measures before its collision on earth. Therefore, the new formula which is more accurate and simple is derived mathematically and may have applications in the field of astronomical research, studies and observations. The theorem, which has been defined in this paper is also useful for those doing research or further study in the field of conics and Euclidean geometry [Eric Weisstein (2002)] since this is also one of the important properties of an ellipse. It is an advancement in Geometry and Menstruation [Eric Weisstein (2002)] related to ellipse.

## NOMENCLATURES

$$
\begin{aligned}
a & =\text { Semi-major axis } \\
b & =\text { Semi-minor axis } \\
e & =\text { Eccentricity of ellipse e } \leq 1.0 \\
p & =\text { Perimeter or Perimeter of ellipse } \\
\pi & =\text { A transcendental number } \approx 3.14159265358979 \ldots \\
h & =\left(\frac{a-b}{a+b}\right)^{2} \\
y & =\frac{\ln (2)}{\ln \left(\frac{\pi}{2}\right)} \\
H_{p} & =\text { Holder mean of the principal radii }=\left[\frac{\left(a^{p}+b^{p}\right)}{2}\right]^{\frac{1}{p}} \\
p & =\frac{3}{2} \\
H_{-p} & =\frac{a b}{H_{p}} \\
f & =h^{6} \\
\delta & =\left(\frac{a^{2}-b^{2}}{a^{2}+b^{2}}\right)^{2} \\
r_{y} & =\text { Perimeter-radius } \\
k & =
\end{aligned}
$$

## ACKNOWLEDGEMENT S

It gives immense pleasure to thank all those who extended their coordination, moral support, guidance and encouraged to reach the publication of the paper. My special thanks to my friend Prof. L. Jawahar Nesan, Sirkali, T.N for his help, providing many useful ideas and suggestions in 1996 for publication of my first research paper. My sincere and heartiest thanks are extended to my friends Mr. S. Raju, F\&AO, CSIR-CLRI, Chennai, T.N, Er. P. Selvakumar, A.E (Civil), All India Radio, Chennai, T.N, Er. P. Kanthasamy, S.T.O-3, CSIR-CLRI, Chennai and Mr. S. Nagarajan, Senior Scientist, CSIR-CFTRI, Mysore. My special thanks to Dr. V. Prakash, Former Director- CFTRI, all senior staff and colleague in CSIR- CFTRI, Mysore for their full support and co-ordination. I would also like to express my heartiest thanks to the then Teaching staff of (i) P.U.E. School, Manalagaram, Sirkali Taluk, T.N (ii) L.M.C.H.S. School, Sirkali, T.N (iii) S.M.H.H.S. School, Sirkali, T.N and (iv) A.C.C.E.T, Karaikudi, T.N.
