### ABSTRACT

Plant parts of *Dolichandrone falcata* (DC) Seem were extracted with different solvents such as methanol, ethyl acetate, alcohol, acetone, water. The antimicrobial assay of *D. falcata* extracts were evaluated on bacterial and fungal strains like *Pseudomonas aeruginosa*, *Bacillus subtilis*, *Candida albicans*, *Vibrio cholerae and Salmonella typhi*. Phytochemical screening was performed for alkaloids, terpenoids, tannins, saponins steroids, cardiac glycosides and flavonoids. Various solvent extracts were examined using agar disk diffusion method against bacterial and fungal microorganisms.

### Key Words: Antimicrobial Assay

### INTRODUCTION

Plants are the richest source of organic chemicals on the earth. Most of the medicinal plants were using in Indian traditional medicine to cure various diseases. The indigenous system of medicine namely ayurveda, unani and siddha have been in existence in several centuries. In India about seventy percent population residing in the villages and these people depend on herbal medicine to cure ailments. Nature has bestowed a rich botanical wealth with its diversity in varied topography and changed agro climatic conditions in different parts of country (Chaudhari, 1980). The world is looking towards India for new drugs to manage various challenging diseases because of its rich biodiversity of medicinal plants and abundance of traditional knowledge to cure different diseases (Cohen and Alcorn, 1991). In Marathawada Wadwal-Nagnath of Chakur Tahsil in Latur district has numerous medicinal plants, rustics of the area using the *Dolichandrone falcata* for curing diseases like allergy, inflammatory problems, cancer etc. therefore present study was planned to screen phytochemicals and assess the antimicrobial efficacy.

### Plant Morphology

*Dolichondrone falcata* is a small deciduous tree with bluish-gray bark, peeling in irregular woody scales. Leaves are pinnately compound, 3-6 inches long. Leaflets are 5-7, obovate or round elliptic, sometimes with a small blunt point. Leaflet blade is about 1.2 cm long and wide. Flowers are white, borne in mostly 1-3 flowered corymbs. Flower stalk is 1/2 inch long. Sepal tube is 1.2-2 cm, split on one side to the base, petals are frilly. Capsules are nearly quadrangular, curved like a sickle. The capsules look like curved sheep horns so locally it is termed as medhshingi flowering during May-June.

### Uses

The *Dolichandrone falcata of* family Bignoniaceae is a traditional medicinal plant used in ayurvedic medicine for fish poison and to procure abortion (Kirtikar, 1999). Leaf juice is also used for the treatment of diabetes.

### MATERIALS AND METHODS

Plant materials were collected from Wadwal-Nagnath of Latur district during September 2010. The identification is done with the help of standard floras (Naik, 1979; Naik *et al.*, 1998 and Singh and Karthikeyan, 2001). The plant is shade dried, powdered and stored in airtight container.

## **Research** Article

### **Preparation of Extract**

Powder obtained was subjected to successive soxhlet extraction with increasing order of polarity i.e. Acetone (56 to  $60^{\circ}$  c), distilled water ( $60-70^{\circ}$  c) Alcohol ( $60^{\circ}$  to  $80^{\circ}$  c), Ethyl acetate ( $60^{\circ}$  to  $80^{\circ}$  c), Methanol ( $65.5^{\circ}$  c -  $70.5^{\circ}$  c) (Daniel, 1991).

### Test-Micro-Organism

The micro-organisms such as *Bacillus substilis* MTCC (1091), *Pseudomonas aeruginosa* MTCC (708), *Candida albicans* MTCC 3971), *Vibrio cholerae and Salmonella typhi* were obtained from stock cultures and maintained on Mullar Hinton agar and potato dextrose agar slant for bacteria and fungi respectively and stored at 6°c until used. To prepare suspension, the slants were incubated at 37°c for 24 hours and inoculum was prepared by MacFarland turbidity standards.

### Antimicrobial Screening of Extracts

The agar well diffusion method was used to test the antimicrobial activity of the extracts. The cultures were prepared and incubated at  $37^{\circ}$ c for 24 hours. The antimicrobial activity was observed on basis of inhibition zone that was compared with standard antibiotic. 0.2 ml broth culture of the test organism was put in a sterile petriplate and 18 ml of sterile agar was added. After solidification of agar, wells were punched and filled with respective solvent extracts. Streptomycin is used as the standard antimicrobial agent at a concentration of 10 mcg/ disk. The plates were kept in sterilized inoculation chamber for 2 h to facilitate diffusion of the antimicrobial agents into the medium. The plates were then incubated at  $37^{\circ}$  c for 24 hours and the diameter of zone of inhibition of microbial growth was measured in the plates in millimeters.

### **RESULTS AND OBSERVATION**

### **Phytochemical Screening**

The preliminary phytochemical screening of leaf extracts of *D. falcata* reveals that alkaloids are present in methanol and acetone extracts. Saponin is obtained in aqueous, alcohol and ethyl acetate extract. Terpenoids found in aqueous and alcohol extracts. Tannins present in aqueous, methanol, alcohol and ethyl acetate extract. Steroids present in aqueous, methanol, alcohol and ethyl acetate extract. Cardiac glycosides obtained in methanol, alcohol, acetone and ethyl acetate extract. Flavonoids are present in aqueous, methanol and alcoholic extracts (Table no 1).

Chemical composition	Aqueous	Methanol	Alcohol	Acetone	Ethyl acetate
Alkaloid		+		+	
Saponin	+		+		+
Terpenoid	+		+		
Tannin	+	+	+		+
Steroids	+	+		+	
Cardiac glycoside		+	+	+	+
Flavonoid	+	+	+		

 Table 1: Phytochemical screening of various extracts of leaf

The preliminary phytochemical screening of bark extracts of *D. falcata* reveals that the presence of alkoloids in methanol, alcohol and ethyl acetate extract. Saponins are present in aqueous and alcohol extracts. The terpenoids are obtained in aqueous, methanol, acetone and ethyl acetate extracts. Tannins are found in aqueous, methanol, alcohol and ethyl acetate extract. Steroids are absent in all extracts. Cardiac glycosides are present in all extracts except water. Flavonoids are found in aqueous, methanol, alcohol and ethyl acetate extract.

Antimicrobial Assay

The acetone leaf extract exhibited more activity against *Salmonella typhi*. The ethyl acetate leaf extract exhibit more activity against *Candida albicans*. Whereas the leaf extracts were inactive against *Vibrio cholerae, Bacillus subtilis* and *Pseudomonas aeruginosa,* as compared with standard antibiotic Streptomycin (Table no 4).

	Organisms		Zone of inhibition (mm) Plant extract					
		EAL	ACL	DTL	ALL	MTL	Control	
1.	S.typhi	05	11		07	07	08	
2.	V.cholerae	09				04	10	
3.	B. subtilis	05	05		06	05	11	
4.	C.albicans	11	09	09	06	07	09	
5.	P.aeruginosa	14	06	03		10	14	

### Table 4: Antimicrobial assay of leaf extract

Leaf Extract: EAL: Ethyl acetate; ACL: Acetone; DTL: Distilled water; ALL: Alcohol; MTL: methanol. The acetone, distilled water bark extracts are more active against *Salmonella typhi*. The methanol bark extract exhibited activity against *Vibrio cholerae* and *Pseudomonas aeruginosa*. The alcohol bark extract exhibited activity against *Candida albicans*. While bark extract does not exhibit any activity against *Bacillus subtilis* as comparable to antibiotic Streptomycin (Table no 5).

4.	C.albicans	10	13	07	10	08	06		
5.	P.aeruginosa	13	05	05	05	12	11		

Fruit Extracts: EAF: Ethyl acetate; ACF: Acetone; DTF: Distilled water; ALF: Alcohol; MTF: Methanol

### DISCUSSION

The present work was carried out for preliminary phytochemical screening and antimicrobial activity of *D. falcata*. It reveals that the presence of alkaloids, flavonoids, tannins, saponins, terpenoids, cardiac glycosides and steroids in different extracts of leaves, bark and fruit. Similar results were also obtained by Mungle *et al.*, (2012),

The ethyl acetate leaf extracts exhibit activity against Candida albicans, while fruit extract is active against Candida albicans and P. aeruginosa. Whereas the bark extract does not show any activity against test organism.

The acetone fruit extract shows inhibitory activity against *Candida albicans*. The leaf and bark extract exhibit activity against *Salmonella typhi*.

The distilled water fruit extract exhibit activity against *Candida albicans* and *Vibrio cholerae* while bark extract against *Salmonella typhi* whereas the leaf extract does not exhibit any activity against test organism.

The alcohol fruit and bark extract exhibit activity against *Candida albicans* whereas leaf extract does not show any liability activity against test organism.

The methanol fruit extract exhibit inhibitory activity against *Vibrio cholerae*, *Candida albicans* and *P. aeruginosa*. Whereas the bark extract is active against *Vibrio cholerae* and *P. aeruginosa*. But the leaf extract does not show any activity against test organism.

Antimicrobial assay of present study reveals that the fruit extract of *D. falacata* shows considerable activity against *Candida albicans* and moderate activity against *P. aeruginosa* and *Vibrio cholarae*. The bark extract of *D. falcata* show good inhibitory activity against *Salmonella typhi* and moderate activity

Indian Journal of Plant Sciences ISSN: 2319-3824 (Online) An Online International Journal Available at http://www.cibtech.org/jps.htm 2013 Vol. 2 (1) January-March, pp.80-85/Patil and Biradar

# **Research Article**

exhibited against Vibrio cholerae, Candida albicans and P. aeruginosa. The leaf extracts exhibit moderate activity against Salmonella typhi and Candida albicans.

The presence of phytochemical compounds has been known to show medicinal activity as well as exhibit and regulate some physiological activity (Sofovora, 1993 and Harbone, 1998). Tannin prevents development of micro-organism by precipitating microbial protein and making it into unavailable form (Ogunleye and Ibitoye, 2003). The tannins have been traditionally used on inflamed surface of mouth, in the treatment of catarrh and it also have antioxidant properties (Sodipo *et al.*, 1991 and Stephan *et al.*, 2009). The importance of steroids as a potent staring material in the synthesis of sex hormone was reported by Okeke (2003). From the phytochemical analysis it was found that steroid, flavonoids and tannins of several plants extracts are being used for the treatment of diabetes (Kokate *et al.*, 2003).

### Conclusion

*Dolichandrone falcata* has highest significance for its valuable secondary metabolites. Plant extracts that inhibit the growth of pathogenic microorganisms without harming the host may have potential application as therapeutic agents. Hence, the present investigation attempted to evaluate antimicrobial activity of crude extracts from leaves, fruits and barks of *D. falcata* against some human pathogenic and non-pathogenic bacterial and fungal strains.

Successive water, acetone, alcohol, ethyl acetate and methanol extracts of *D. falcata* leaf, fruit and bark extracts were tested for the screening of phytochemical constituents. Maximum diversity of chemical constituents was found in methanol, ethyl acetate and alcoholic extracts in leaf, bark and fruit. The methanol and alcohol extracts were found active against most of the tested pathogenic organisms as they showed potential phytochemical constituents. Among the tested species *C. albicans* showed greatest sensitivity against alcoholic bark extract.

Finally it is concluded the fruit extract is active against Vibrio cholerae, Candida albicans and P. aeruginosa but it is not active against Salmonella typhi and Bacillus albicans. The bark extract is effective against Salmonella typhi, Vibrio cholerae, Candida albicans and P. aeruginosa and it is not effective against Bacillus subtilis. The leaf extracts shows inhibitory effect against Salmonella typhi and Candida albicans only. The fruit and bark extract of D. falcata shows good zone of inhibition against all test organisms except Bacillus subtilis.

The plant products plays an important role in the treatment of diseases without any side effects, there is a need to search new drugs from natural sources. India is a home to a variety of traditional medicine system that relay to a very large extent on native plant species for new drug materials (Ramdas *et al.*, 2006). Therefore now there is a need to look back towards traditional medicine which can serve a novel therapeutic agent (Chitravadivu *et al.*, 2009). The pharmacognostical evaluations also give valuable information which is essential to standardize the drug.

### ACKNOWLEDGEMENT

Authors are thankful to Dr. P. L. More, Principal Dnyanopasak College, Parbhani for providing necessary facilities and encouragement.
